

V.I.K.I. DEEP ANATOMY REPORT

ID: VCR-2026-001 | DATE: 2026-06-21

AGENT: virattt/financial-agent

[01] VULNERABILITY ORIGIN (The 'Why')

The agent uses a Zero-Shot prompting technique without post-generation validation. It lacks a deterministic 'sanity check' for mathematical outputs, relying entirely on the LLM's internal weights to respect budget constraints.

[02] ARCHITECTURAL FLAW (The 'Where')

File: agent.py

Line 42: `result = self.llm.call(prompt)`

Line 43: `execute_trade(result['amount'])` # <-- CRITICAL: Direct execution without SRC check

[03] RSA INTERVENTION (The 'How')

V.I.K.I. Sentinel intercepted the 'execute_trade' intent. The SRC Sensor detected a \$450 discrepancy between the Enterprise Limit (\$1000) and the Agent's Hallucination (\$1450). The Execution Boundary was severed.

[04] TRAJECTORY COMPARISON

Vanilla Path: Intent -> Execution -> \$450 Financial Loss.

Guarded Path: Intent -> V.I.K.I. Interception -> HALT -> 0\$ Loss.
